Other-regarding preferences, spousal disability and happiness: Evidence from German couples

Nils Braakmann*

Leuphana University Lüneburg

[This version: May 22, 2009]

Abstract:

This paper considers the impact of adverse health shocks that hit an individual's partner on subjective well-being. Using data on couples from the German Socio-Economic Panel for the years 1984 to 2006, I compare the losses in well-being caused by own and spousal disability using panel-regressions. I find that women and to a lesser extent men are harmed by spousal disability which is consistent with the existence of other-regarding preferences within couples. The magnitude of effects suggests that spousal disability is about one quarter to one half as harmful as individual disability with larger effects being found for women.

Keywords: disability, subjective well-being, other-regarding preferences

JEL Classification: D64, I10, J14

The data from the German Socio-Economic Panel (SOEP) used in this paper are provided by the DIW Berlin. See <http://www.diw.de> for details. All analyses used Stata 10.1. Do-Files are available from the author on request.

I MOTIVATION

This paper studies the strength of other-regarding preferences using non-experimental data. Specifically, I use longitudinal data on German couples to study the effects of plausibly exogenous changes in the respective partner's health on individual life satisfaction and compare these with the effects of changes in individual health. Evidence from life satisfaction regressions suggests that women and to a lesser extent men are harmed by spousal disability which is consistent with the existence of other-regarding preferences within couples. The magnitude of effects suggests that spousal disability is about one fifth to one half as harmful as individual disability with larger effects being found for women.

In a broad sense, *other-regarding* or *social preferences* refer to situations where individual utility does not only depend on commodities and goods that are at the individual's disposal, but also on goods or the well-being of some reference group.¹ Fehr and Fischbacher (2002) provide evidence on the economic consequences of such preferences, while Fehr and Schmidt (2003) and Sobel (2005) summarize various ways to model such preferences and the (mostly experimental) evidence in favor of them.

The purpose of this paper is relatively straightforward: I study the strength of social preferences using information on subjective well-being and changes in the disability status of the respective partner within German couples using data from the German Socio-Economic Panel (GSOEP) for the years 1984 to 2006. The main idea here is rather simple: If an individual's subjective well-being drops after his or her partner becomes disabled and if we are able to rule out confounding explanations for this drop, e.g. the probably unavoidable loss of household income caused by the disability of a household member, then this drop can be interpreted as the loss of utility caused by the harm of the respective partner. Additionally, I

¹ Additionally, individual utility may depend on one's relative positions in a group, see e.g. Clark et al. (2009) for recent evidence.

provide comparisons with the loss in well-being that is caused by individual disability to help in gauging the strength of these effects.

To the best of my knowledge, this paper is the first to use subjective measures of well-being and variation of a partner's health status to study the strength of social preferences. On a practical level, the results may also be useful as a quantification of individual suffering when calculating e.g. compensating payments after accidents that led to disability.

Using the setup described above has a number of advantages in the context of this analysis. First, while it is notoriously difficult to identify an individual's reference group in many settings, it seems very likely that individuals care for the well-being of their respective partner within couples. In fact, Winkelmann (2005) and Bruhin and Winkelmann (2008) provide direct evidence that measures of subjective well-being within families are correlated and that social preferences exist within families. Secondly, the fact that disability leads to (at least partially permanent) losses in well-being has been well documented in the literature (see e.g. Ferrer-i-Carbonell and van Praag [2002], Lucas [2007], Oswald and Powdthavee [2007] and Ville et al [2001]).² Thirdly, changes in a partner's disability status can be plausibly assumed to be exogenous in individual life-satisfaction regressions (see Oswald and Powdthavee [2007], Wu [2001] relies on a similar argument when using heart conditions) - at least to a greater extent than other possible adverse events, e.g. unemployment, that could affect the partner's well-being. Finally, the data allows me to use changes in a partner's health status within couples while controlling for possible confounders, like the likely income loss following disability, as well as for individual unobserved heterogeneity.

The remainder of this paper is organized as follows: Section 2 presents the data and descriptive evidence. The identification strategy is outlined in section 3, results follow in section 4. Section 5 concludes.

² Similar evidence exists for other types of (permanent) disease, see e.g. Groot et al. (2004) and Wu (2001).

II DATA AND DESCRIPTIVE EVIDENCE

The data come from the 1984 to 2006 waves of the German Socio-Economic Panel (SOEP, see Wagner, Frick, Schupp [2007] for a general overview), a representative longitudinal household survey of the German population provided by the DIW Berlin. Further information on the sampling design as well as additional information on the overall structure of the SOEP can be found in Haisken-DeNew and Frick (2005).

I use two measures of disability, both tied to the definition of a disabled person in German social security legislation. The first is an indicator whether an individual is considered to be severely disabled by German law. This is the case when the degree of disability, as determined by an official medical examination exceeds 50, which equals e.g. the loss of a lower arm or the loss of a hand. Individuals with a degree of disability between 30 and 50 may obtain disability status when they would otherwise be unable to find a job (see §2 SGB IX, book 9 of the German social security code). The second measure is the degree of disability which runs from 0 to 100 (in steps of 5 or 10). The conditions that have to be fulfilled for a certain degree are legally fixed and are laid down in the *Anhaltspunkte für die ärztliche Gutachtertätigkeit* (see e.g. Schillings and Wendler [2006]). About 85% of all disabilities are caused by disease, while roughly 5% are congenital, related to accidents or to war wounds respectively (see Statistisches Bundesamt [2003]). Note that changes in the disability measures observed in the sample are most likely caused by disability or accidents as congenital disabilities are fixed at birth and those related to war wounds are almost exclusively the results of World War II and are consequently fixed before the observation period.

The measure of subjective well-being is the answer to the direct question “How satisfied are you with your life, all things considered? Please answer according to the following scale: 0

means completely dissatisfied, 10 means completely satisfied.” that is usually applied in the subjective well-being literature.

I restrict the sample to individuals between 18 and 75 years and keep only those observations where a partner is present and has non-missing information on his or her disability status. I also drop observations where the variation in the partner’s disability status arises through changes of the respective partner. These cases could bias the estimates if e.g. a change in partner raises happiness and individuals are more likely to change partners after he or she becomes disabled. However, results are almost identical when keeping these observations. After dropping observations with missing information on any control variable, I end up with 52,072 person-year-observations from 8,778 men and with 50,951 person-year-observations from 8,725 women. Descriptive statistics for both samples can be found in table 1.

[TABLE 1 ABOUT HERE.]

Figures 1 and 2 plot the distribution of the well-being measures for men and women without a disability, for disabled individuals and for individuals with a disabled partner. Both men and women report lower levels of happiness when either they or their partner become disabled. This difference in happiness is larger for individual disability and seems also larger for women than for men. Apart from that both figures show the relatively common result that individuals are on average quite happy with their lives as the mode values of 7 and 8 in each panel indicate.

[FIGURES 1 AND 2 ABOUT HERE.]

Figure 3 plots the difference in average happiness before and after the onset of disability for individuals who became disabled (left panels) and for individuals whose partner became disabled (right panels). For most cases, we observe a decline in average happiness after the onset of disability. This decline seems somewhat stronger for individuals who became

themselves disabled but can also be observed for individuals who faced the disability of their partner.

[FIGURE 3 ABOUT HERE.]

III ESTIMATION

I consider the estimating equation

$$y_{it} = \alpha_i + \theta_t + \beta'X_{it} + \tau*D_{it} + \varepsilon_{it}, \quad (1)$$

where α_i and θ_t are individual and year fixed-effects, X_{it} contains time-varying control variables, ε_{it} is a standard error term and D_{it} is the respective measure of disability. Depending on the model D_{it} contains either a dummy variable indicating (legal) disability status (Model I), the degree of disability in a linear specification (Model II) or dummies for various degrees of disability to allow for non-linear effects (Model III). The included control variables are a set of dummies for household composition (which includes information on children), dummies for labor force status and nationality, age and age squared, years of education and work and unemployment experience. To control for changes in income that seem likely after a household member becomes disabled, I also include monthly net household income. The effect of disability on happiness, τ , is identified using (joint) changes in (own and partner's) disability status and subjective well-being within individuals. All standard errors are adjusted for clustering on the individual level.

To apply the usual within-estimator, I treat the measure of subjective well-being as metric. I also experimented with the simpler version of the Ferrer-i-Carbonell and Fritjers (2004) estimator used by Kassenboehmer and Haisken-DeNew (2009). Here, the measure of well-being is collapsed into a binary variable indicating above-average happiness using individual specific thresholds and Chamberlain's (1980) conditional logit estimator is used for estimation. Unfortunately, this model did not converge when adding time dummies. However, as the results in models without time dummies were generally identical between the

conditional logit and the within-estimator, the choice of the estimator seems relatively innocuous. This result is similar to the findings by Ferrer-i-Carbonell and Fritjers (2004) who also reported a relatively minor impact of the choice between cardinal and ordinal subjective well-being.

Another issue is the question whether disability is indeed exogenous in life-satisfaction regressions or whether there are unobserved confounders that are correlated with both subjective well-being and disability. Remember from section 2 that changes in disability status during the observation period are the results of disease or to a much lesser extent accidents, while disabilities from war wounds and congenital disabilities are likely fixed at the beginning of the observation period. Note further that we can essentially rule out biological confounders that make individuals more vulnerable to disease and intrinsically less happy as these should be captured by the fixed effects. This holds to an even stronger degree when talking about the respective partner's disability. The essential assumption needed to give τ a causal interpretation is that changes in disability status are uncorrelated with unexplained changes in well-being which seems plausible.

IV RESULTS

Consider the estimation results for men in table 2 and for women in table 3. Both tables show similar responses to the onset of individual disability. Using the simple disability dummy in Model I, I find drops in happiness in the magnitude of -0.27 to -0.28. This drop roughly equals the happiness loss associated with a decline in monthly household income by 2,700 to 2,800 € which is more than the mean income in the sample. Using a linear specification for the degree of disability the drop in happiness by a 1 point increase is estimated to be -0.0063 or -0.0072 which equals income losses by 63 or 72€. For Model III, the results show penalties that are rising with the degree of disability and that become particularly large for degrees of disability above 80. The loss of happiness caused by going from a degree of disability of 0 to

90 to 100 lies between -0.88 and -0.96 which is roughly equal to a loss in household income by 8,800 to 9,600 €.

[TABLES 2 AND 3 ABOUT HERE.]

Now compare these with the results for the respective partner's disability. Intuitively we would expect that the effects of the partner's disability on individual well-being lie somewhere between zero and the effects of individual disability. Positive effects would indicate that individuals actually enjoy adverse shocks to their partner's health, while effects greater than the effects for individual disability would suggest that individuals are harmed more by their partner's suffering than by their own which seems both unlikely.

A look at the results reveals marked differences between men and women. Men generally seem to be unaffected by all but the most extreme forms of their partner's disability. Point estimates for the disability dummy as well as for a linear increase in the degree of disability are generally small and consequently insignificant. Similarly, the point estimates for the degree of disability dummies are often small and with the exception of the highest degree of disability always insignificant. For the latter, we see a drop in happiness that is roughly equal to one quarter of the effect for the corresponding degree of own disability. The relation of these last-mentioned effects generally fits the results by Winkelmann (2005) who estimated the correlation of well-being between spouses to be 0.2.

The results for women stand in stark contrast to those for men as large and significantly negative effects are found in all models. Specifically, I find a drop in subjective well-being of -0.14 using the simple disability dummy while the effect in the linear specification using the degree of disability is found to be -0.0032. The latter results seem to be driven by the huge losses in well-being associated with the higher levels of the partner's disability as can be seen from the dummy specification in Model III. The effects of the partner's disability lie roughly between one third and one half of the effects of individual disability.

Taken together, the results suggest that the well-being of women and to some extent men is harmed by the suffering of their partner which is consistent with the existence of other-regarding preferences within couples. The magnitude of the (significant) results is broadly in line with previous evidence by Winkelmann (2005) and suggests that the loss of well-being caused by a permanent adverse health shock to an individual's partner is between one quarter and one half of the corresponding loss by the same health shock to the respective individual. Additionally, the results imply that men and women react very differently to adverse health shocks that hit their respective partners despite similar reactions to adverse shocks to their own health.

While these results suggest gender-specific differences in the strength of other-regarding preferences, they could simply be the results of the decline in economic opportunities the household faces as one of its members suffers an adverse health shock. The latter effect could in principle be stronger for women if they are economically more dependent on their partner than men and hence lose relatively more by his disability and possible inability to work. However, there are two reasons that make this explanation unlikely. First, all estimates control for net household income and labor force status which should capture the largest part of a possible economic decline. Secondly, if the drop in subjective well-being due to the partner's disability is caused by a decline in economic opportunities and if this decline differs between men and women, the drop in well-being caused by *individual* disability should also differ between men and women which is clearly not the case.

V CONCLUSION

This paper demonstrated that individuals suffer losses in subjective well-being when their respective partner is hit by a permanent adverse health shock, specifically disability. This finding is consistent with the existence of other-regarding preferences within couples. Using longitudinal panel data on German couples from the Socio-Economic Panel for the years 1984

to 2006, I compared the losses in subjective well-being caused by the onset of own disability with the losses caused by the disability of the respective partner while controlling for economic conditions and unobserved heterogeneity. The results indicate that women and to a lesser extent men suffer losses in subjective well-being from the disability of their partner. The magnitude of results suggests that the disability of a partner is about one quarter to one half as harmful as individual disability. This finding is broadly in line with previous findings by Winkelmann (2005) who estimated the correlations of subjective well-being among spouses to be 0.2. Furthermore, the results of this paper suggest that women are harmed much more by their partner's disability, while showing similar reactions to individual disability.

Working Paper Series in Economics

(recent issues)

- No.129: *Alexander Vogel and Joachim Wagner*: Exports and Profitability – First Evidence for German Services Enterprises, May 2009
- No.128: *Sebastian Troch*: Drittelbeteiligung im Aufsichtsrat – Gesetzliche Regelung versus Unternehmenspraxis. Ausmaß und Bestimmungsgründe der Umgehung des Drittelbeteiligungsgesetzes in Industrieunternehmen, Mai 2009
- No.127: *Alexander Vogel*: The German Business Services Statistics Panel 2003 to 2007, May 2009
[forthcoming in: Schmollers Jahrbuch 129 (2009)]
- No.126: *Nils Braakmann*: The role of firm-level and regional human capital for the social returns to education – Evidence from German social security data, April 2009
- No.125: *Elke Bertke und Markus Groth*: Angebot und Nachfrage nach Umweltleistungen in einem marktanalogen Agrarumweltprogramm – Ergebnisse einer Pilotstudie, April 2009
- No.124: *Nils Braakmann and Alexander Vogel*: The impact of the 2004 EU-enlargement on enterprise performance and exports of service enterprises in the German eastern border region, April 2009
- No.123: *Alexander Eickelpasch and Alexander Vogel*: Determinants of Export Behaviour of German Business Services Companies, March 2009
- No.122: *Maik Heinemann*: Stability under Learning of Equilibria in Financial Markets with Supply Information, March 2009
- No.121: *Thomas Wein*: Auf der Speisekarte der DPAG: Rechtliche oder ökonomische Marktzutrittsschranken? März 2009
- No.120: *Nils Braakmann und Joachim Wagner*: Product Diversification and Stability of Employment and Sales: First Evidence from German Manufacturing Firms, February 2009
- No.119: *Markus Groth*: The transferability and performance of payment-by-results biodiversity conservation procurement auctions: empirical evidence from northernmost Germany, February 2009
- No.118: *Anja Klaubert*: Being religious – A Question of Incentives? February 2009
- No.117: *Sourafel Girma, Holger Görg and Joachim Wagner*: Subsidies and Exports in Germany. First Evidence from Enterprise Panel Data, January 2009
- No.116: *Alexander Vogel und Joachim Wagner*: Import, Export und Produktivität in niedersächsischen Unternehmen des Verarbeitenden Gewerbes, Januar 2009
- No.115: *Nils Braakmann and Joachim Wagner*: Product Differentiation and Profitability in German Manufacturing Firms, January 2009
- No.114: *Franziska Boneberg*: Die Drittelmitbestimmungslücke im Dienstleistungssektor: Ausmaß und Bestimmungsgründe, Januar 2009
- No.113: *Institut für Volkswirtschaftslehre*: Forschungsbericht 2008, Januar 2009
- No.112: *Nils Braakmann*: The role of psychological traits and the gender gap in full-time employment and wages: Evidence from Germany. January 2009
- No.111: *Alexander Vogel*: Exporter Performance in the German Business Services Sector: First Evidence from the Services Statistics Panel. January 2009
[revised version forthcoming in: The Service Industries Journal]

- No.110: *Joachim Wagner*: Wer wird subventioniert? Subventionen in deutschen Industrieunternehmen 1999 – 2006. Januar 2009
- No.109: *Martin F. Quaas, Stefan Baumgärtner, Sandra Derissen, and Sebastian Strunz*: Institutions and preferences determine resilience of ecological-economic systems. December 2008
- No.108: *Maik Heinemann*: Messung und Darstellung von Ungleichheit. November 2008
- No.107: *Claus Schnabel & Joachim Wagner*: Union Membership and Age: The inverted U-shape hypothesis under test. November 2008
- No.106: *Alexander Vogel & Joachim Wagner*: Higher Productivity in Importing German Manufacturing Firms: Self-selection, Learning from Importing, or Both? November 2008
[revised version forthcoming in: Review of World Economics]
- No.105: *Markus Groth*: Kosteneffizienter und effektiver Biodiversitätsschutz durch Ausschreibungen und eine ergebnisorientierte Honorierung: Das Modellprojekt „Blühendes Steinburg“. November 2008
- No.104: *Alexander Vogel & Joachim Wagner*: Export, Import und Produktivität wissensintensiver KMUs in Deutschland. Oktober 2008
- No.103: *Christiane Clemens & Maik Heinemann*: On Entrepreneurial Risk – Taking and the Macroeconomic Effects Of Financial Constraints, October 2008
- No.102: *Helmut Fryges & Joachim Wagner*: Exports and Profitability – First Evidence for German Manufacturing Firms. October 2008
- No.101: *Heike Wetzel*: Productivity Growth in European Railways: Technological Progress, Efficiency Change and Scale Effects. October 2008
- No.100: *Henry Sabrowski*: Inflation Expectation Formation of German Consumers: Rational or Adaptive? October 2008
- No.99: *Joachim Wagner*: Produktdifferenzierung in deutschen Industrieunternehmen 1995 – 2004: Ausmaß und Bestimmungsgründe, Oktober 2008
- No.98: *Jan Kranich*: Agglomeration, vertical specialization, and the strength of industrial linkages, September 2008
- No.97: *Joachim Wagner*: Exports and firm characteristics - First evidence from Fractional Probit Panel Estimates, August 2008
- No.96: *Nils Braakmann*: The smoking wage penalty in the United Kingdom: Regression and matching evidence from the British Household Panel Survey, August 2008
- No.95: *Joachim Wagner*: Exportaktivitäten und Rendite in niedersächsischen Industrieunternehmen, August 2008
[publiziert in: Statistische Monatshefte Niedersachsen 62 (2008), 10,552-560]
- No.94: *Joachim Wagner*: Wirken sich Exportaktivitäten positiv auf die Rendite von deutschen Industrieunternehmen aus?, August 2008
[publiziert in: Wirtschaftsdienst, 88 (2008) 10, 690-696]
- No.93: *Claus Schnabel & Joachim Wagner*: The aging of the unions in West Germany, 1980-2006, August 2008
[forthcoming in: Jahrbücher für Nationalökonomie und Statistik]

- No.92: *Alexander Vogel and Stefan Dittrich*: The German turnover tax statistics panels, August 2008
[published in: Schmollers Jahrbuch 128 (2008), 4, 661-670]
- No.91: *Nils Braakmann*: Crime does pay (at least when it's violent!) – On the compensating wage differentials of high regional crime levels, July 2008
- No.90: *Nils Braakmann*: Fields of training, plant characteristics and the gender wage gap in entry wages among skilled workers – Evidence from German administrative data, July 2008
- No.89: *Alexander Vogel*: Exports productivity in the German business services sector: First evidence from the Turnover Tax Statistics panel, July 2008
- No.88: *Joachim Wagner*: Improvements and future challenges for the research infrastructure in the field *Firm Level Data*, June 2008
- No.87: *Markus Groth*: A review of the German mandatory deposit for one-way drinks packaging and drinks packaging taxes in Europe, June 2008
- No.86: *Heike Wetzel*: European railway deregulation. The influence of regulatory and environmental conditions on efficiency, May 2008
- No.85: *Nils Braakmann*: Non scholae, sed vitae discimus! - The importance of fields of study for the gender wage gap among German university graduates during market entry and the first years of their careers, May 2008
- No.84: *Markus Groth*: Private ex-ante transaction costs for repeated biodiversity conservation auctions: A case study, May 2008
- No.83: *Jan Kranich*: R&D and the agglomeration of industries, April 2008
- No.82: *Alexander Vogel*: Zur Exporttätigkeit unternehmensnaher Dienstleister in Niedersachsen - Erste Ergebnisse zu Export und Produktivität auf Basis des Umsatzsteuerstatistikpanels, April 2008
- No.81: *Joachim Wagner*: Exporte und Firmenerfolg: Welche Firmen profitieren wie vom internationalen Handel?, März 2008
- No.80: *Stefan Baumgärtner*: Managing increasing environmental risks through agrobiodiversity and agri-environmental policies, March 2008
- No.79: *Thomas Huth*: Die Quantitätstheorie des Geldes – Eine keynesianische Reformulierung, März 2008
- No.78: *Markus Groth*: An empirical examination of repeated auctions for biodiversity conservation contracts, March 2008
- No.77: *Nils Braakmann*: Intra-firm wage inequality and firm performance – First evidence from German linked employer-employee-data, February 2008
- No.76: *Markus Groth*: Perspektiven der Nutzung von Methanhydraten als Energieträger – Eine Bestandsaufnahme, Februar 2008
- No.75: *Stefan Baumgärtner, Christian Becker, Karin Frank, Birgit Müller & Christian Quaas*: Relating the philosophy and practice of ecological economics. The role of concepts, models, and case studies in inter- and transdisciplinary sustainability research, January 2008
[published in: Ecological Economics 67 (2008), 3 , 384-393]
